

Robot Programming with Lisp

4. Functional Programming: Higher-order Functions, Currying, Map/Reduce

Arthur Niedzwiecki

Institute for Artificial Intelligence University of Bremen

10th of November, 2022

Pure functional programming concepts include:

• no program state (e.g. no global variables);

Background Concepts Organizational

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;

Background Concepts Organizational

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;
- functions don't have side effects;

Background Concepts Organizational

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;
- functions don't have side effects;
- avoid mutable data, i.e. once created, data structure values don't change (immutable data);

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;
- functions don't have side effects;
- avoid mutable data, i.e. once created, data structure values don't change (immutable data);
- heavy usage of recursions, as opposed to iterative approaches;

Background Concepts Organizational

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;
- functions don't have side effects;
- avoid mutable data, i.e. once created, data structure values don't change (immutable data);
- heavy usage of *recursions*, as opposed to iterative approaches;
- functions as first class citizens, as a result, higher-order functions (simplest analogy: callbacks);

Pure functional programming concepts include:

- no program state (e.g. no global variables);
- referential transparency, i.e. a function called twice with same arguments always generates the same output;
- functions don't have side effects:
- avoid mutable data, i.e. once created, data structure values don't change (immutable data);
- heavy usage of *recursions*, as opposed to iterative approaches;
- functions as first class citizens, as a result, higher-order functions (simplest analogy: callbacks);
- lazy evaluations, i.e. only execute a function call when its result is actually used:

Pure functional programming concepts include:

Mapping and Reducing

Organizational

Background Organizational Concepts

Mapping

Mapping in functional programming is the process of applying a function to all members of a list, returning a list of results.

Supported in most functional programming languages and, in addition

In some of the languages listed the implementation is limited and not elegant.

Mapping [2]

mapcar is the standard mapping function in Common Lisp.

 $\textbf{mapcar function list-1 \&rest more-lists} \Rightarrow \textit{result-list}$

Apply function to elements of list-1. Return list of function return values.

```
mapcar
```

```
CL-USER> (mapcar #'abs '(-2 6 -24 4.6 -0.2d0 -1/5))
(2 6 24 4.6 0.2d0 1/5)
CL-USER> (mapcar #'list '(1 2 3 4))
((1) (2) (3) (4))
CL-USER> (mapcar #'second '((1 2 3) (a b c) (10/3 20/3 30/3)))
?
CL-USER> (mapcar #'+ '(1 2 3 4 5) '(10 20 30 40))
?
CL-USER> (mapcar #'cons '(a b c) '(1 2 3))
?
CL-USER> (mapcar (lambda (x) (expt 10 x)) '(2 3 4))
?
```

Concepts

Background

Organizational

Mapping [2]

mapcar is the standard mapping function in Common Lisp.

mapcar function list-1 & rest more-lists \Rightarrow result-list

Apply function to elements of list-1. Return list of function return values.

```
mapcar
```

```
CL-USER > (mapcar #'abs '(-2 6 -24 4.6 -0.2d0 -1/5))
(2 6 24 4.6 0.2d0 1/5)
CL-USER> (mapcar #'list '(1 2 3 4))
((1) (2) (3) (4))
CL-USER> (mapcar #'second '((1 2 3) (a b c) (10/3 20/3 30/3)))
(2 B 20/3)
CL-USER> (mapcar #'+ '(1 2 3 4 5) '(10 20 30 40))
(11 22 33 44)
CL-USER> (mapcar #'cons '(a b c) '(1 2 3))
((A . 1) (B . 2) (C . 3))
CL-USER> (mapcar (lambda (x) (expt 10 x)) '(2 3 4))
(100 1000 10000)
```

Concepts

Background

Organizational

Mapping [3]

mapc is mostly used for functions with side effects.

mapc function list-1 & rest more-lists ⇒ list-1

```
mapc
CL-USER> (mapc #'set '(*a* *b* *c*) '(1 2 3))
(*A* *B* *C*)
CL-USER> *C*
3
CL-USER> (mapc #'format '(t t) '("hello, " "world~%"))
hello, world
(T T)
CL-USER> (mapc (alexandria:curry #'format t) '("hello, " "world~%"))
hello, world
("hello~%" "world~%")
CL-USER> (mapc (alexandria:curry #'format t "~a ") '(1 2 3 4))
1 2 3 4
(1 2 3 4)
CL-USER> (let (temp)
            (mapc (lambda (x) (push x temp)) '(1 2 3))
           temp)
Background
                                                                Organizational
                                 Concepts
```

Mapping [4]

mapcan combines the results using nconc instead of list.

mapcan function list-1 & rest more-lists \Rightarrow concatenated-results If the results are not lists, the consequences are undefined.

nconc vs list

```
CL-USER> (list '(1 2) nil '(3 45) '(4 8) nil)
((1 2) NIL (3 45) (4 8) NIL)
CL-USER> (nconc '(1 2) nil '(3 45) '(4 8) nil)
(1 2 3 45 4 8)
CL-USER> (nconc '(1 2) nil 3 '(45) '(4 8) nil)
; Evaluation aborted on #<TYPE-ERROR expected-type: LIST datum: 1>.
CL-USER> (let ((first-list (list 1 2 3))
                (second-list (list 4 5)))
            (values (nconc first-list second-list)
                    first-list
                    second-list))
        (1 2 3 4 5)
Background (1 2 3 4 5)
                                 Concepts
                                                                Organizational
         (4 5)
```

Mapping [4]

mapcan combines the results using nconc instead of list.

mapcan function list-1 & rest more-lists \Rightarrow concatenated-results If the results are not lists, the consequences are undefined.

Mapping [5]

maplist, mapl and mapcon operate on sublists of the input list.

maplist function list-1 &rest more-lists ⇒ result-list

```
maplist
CL-USER> (mapcar #'identity '(1 2 3))
(1 \ 2 \ 3)
CL-USER> (maplist #'identity '(1 2 3))
((1 2 3) (2 3) (3))
CL-USER> (maplist (lambda (x)
                     (when (>= (length x) 2)
                        (- (second x) (first x))))
                   '(2 2 3 3 3 2 3 2 3 2 2 3))
                     (0 1 0 0 -1 1 -1 1 -1 0 1 NTL)
CL-USER> (maplist (lambda (a-list) (apply #'* a-list)) '(4 3 2 1))
         (24 6 2 1)
Background
                                 Concepts
                                                                 Organizational
```

Mapping [5]

maplist, mapl and mapcon operate on sublists of the input list.

 ${\sf mapl}$ function list-1 &rest more-lists \Rightarrow list-1

mapcon function list-1 &rest more-lists ⇒ concatenated-results

mapl

```
CL-USER> (let (temp)
	(mapl (lambda (x) (push x temp)) '(1 2 3))
	temp)
((3) (2 3) (1 2 3))
```

mapcon

```
CL-USER> (mapcon #'reverse '(4 3 2 1))
(1 2 3 4 1 2 3 1 2 1)
CL-USER> (mapcon #'identity '(1 2 3 4))
; Evaluation aborted on NIL.
```

Mapping [6]

map is a generalization of mapcar for sequences (lists and vectors).

map result-type function first-sequence & rest more-sequences \Rightarrow result

```
CL-USER> (mapcar #'+ #(1 2 3) #(10 20 30))
The value \#(1\ 2\ 3) is not of type LIST.
CL-USER> (map 'vector #'+ #(1 2 3) #(10 20 30))
#(11 22 33)
CL-USER> (map 'list #'+ '(1 2 3) '(10 20 30))
(11 22 33)
CL-USER> (map 'list #'identity '(#\h #\e #\l #\l #\o))
(\#\h \#\e \#\l \#\l \#\o)
CL-USER> (map 'string #'identity '(#\h #\e #\l #\l #\o))
"hello"
```

Reduction

reduce function sequence &key key from-end start end initial-value ⇒ result Uses a binary operation, function, to combine the elements of sequence.

reduce

```
CL-USER> (reduce (lambda (x y) (list x y)) '(1 2 3 4))
(((1 2) 3) 4)
CL-USER> (reduce (lambda (x y) (format t "~a ~a~%" x y)) '(1 2 3 4))
NTT. 3
NTI 4
CL-USER> (reduce #'+ '()) ; ?
CL-USER> (reduce #'cons '(1 2 3 nil))
CL-USER> (reduce #'cons '(1 2 3) :from-end t :initial-value nil)
CL-USER> (reduce #'+ '((1 2) (3 4) (5 6))
                 :kev #'first :start 1 :initial-value -10)
?
```

MapReduce

Google's MapReduce is a programming paradigm used mostly in huge databases for distributed processing. It was originally used for updating the index of the WWW in their search engine.

Currently supported by AWS, MongoDB, ...

Inspired by the map and reduce paradigms of functional programming.

https://en.wikipedia.org/wiki/MapReduce

MapReduce [2] Example

Task: calculate at which time interval the number of travelers on the tram is the highest (intervals are "early morning", "late morning", ...) Database: per interval hourly entries on number of travelers (e.g. db early morning: $6:00 \rightarrow \text{Tram}6 \rightarrow 100$, $7:00 \rightarrow \text{Tram}8 \rightarrow 120$) Map step: per DB, go through tram lines and sum up travelers:

- DB1 early morning: (Tram6 \rightarrow 2000) (Tram8 \rightarrow 1000) ...
- DB6 late night: (Tram6 \rightarrow 200) (Tram4 \rightarrow 500) ...

Reduce: calculate maximum of all databases for each tram line:

Tram6 \rightarrow 3000 (late morning)

Tram8 \rightarrow 1300 (early evening)

Guidelines

- Avoid global variables! Use them for constants.
- If your function generates side-effects, name it correspondingly (either foo! which is preferred, or foof as in setf, or nfoo as in nconc)
- Use Ctrl-Alt-\ on a selected region to fix indentation
- Try to keep the brackets all together:

This looks weird in Lisp

```
(if condition
 do-this
 do-that
```

Alexandria documentation:
